

Package ‘metaVAR’

July 26, 2024

Title Multivariate Meta-Analysis of Vector Autoregressive Model Coefficients

Version 0.9.1

Description Estimates the mean vector and covariance matrix of the multivariate meta-analysis of vector autoregressive model coefficients.

| coef.metavarmeta | <i>Estimated Parameter Method for an Object of Class metavarmeta</i> |
|------------------|--|

Description

Estimated Parameter Method for an Object of Class metavarmeta

Usage

```
## S3 method for class 'metavarmeta'
coef(object, ...)
```

Arguments

| | |
|--------|---------------------------------|
| object | an object of class metavarmeta. |
| ... | further arguments. |

Value

Returns a vector of the mean estimated parameters.

Author(s)

Ivan Jacob Agaloos Pesigan

| | |
|------|---------------------------------------|
| Meta | <i>Fit Multivariate Meta-Analysis</i> |
|------|---------------------------------------|

Description

This function estimates the mean and covariance matrix of a vector of coefficients using the estimated coefficients and sampling variance-covariance matrix from each individual.

Usage

```
Meta(
  y,
  v,
  mu_start = NULL,
  mu_lbound = NULL,
  mu_ubound = NULL,
  sigma_l_start = NULL,
  sigma_l_lbound = NULL,
  sigma_l_ubound = NULL,
  diag = FALSE,
  try = 1000,
  ncores = NULL
)
```

Arguments

| | |
|-----------------------------|--|
| <code>y</code> | A list. Each element of the list is a numeric vector of estimated coefficients. |
| <code>v</code> | A list. Each element of the list is a sampling variance-covariance matrix of <code>y</code> . |
| <code>mu_start</code> | Numeric vector. Optional vector of starting values for <code>mu</code> . |
| <code>mu_lbound</code> | Numeric vector. Optional vector of lower bound values for <code>mu</code> . |
| <code>mu_ubound</code> | Numeric vector. Optional vector of upper bound values for <code>mu</code> . |
| <code>sigma_l_start</code> | Numeric matrix. Optional matrix of starting values for <code>t(chol(sigma))</code> . |
| <code>sigma_l_lbound</code> | Numeric matrix. Optional matrix of lower bound values for <code>t(chol(sigma))</code> . |
| <code>sigma_l_ubound</code> | Numeric matrix. Optional matrix of upper bound values for <code>t(chol(sigma))</code> . |
| <code>diag</code> | Logical. If <code>diag = TRUE</code> , <code>sigma</code> is a diagonal matrix. If <code>diag = FALSE</code> , <code>sigma</code> is a symmetric matrix. |
| <code>try</code> | Positive integer. Number of extra optimization tries. |
| <code>ncores</code> | Positive integer. Number of cores to use. |

Details

For $i = \{1, \dots, n\}$, the objective function used to estimate the mean $\boldsymbol{\mu}$ and covariance matrix $\boldsymbol{\Sigma}$ of the random coefficients \mathbf{y}_i is given by

$$\ell(\boldsymbol{\mu}, \boldsymbol{\Sigma} \mid \mathbf{y}_i, \mathbb{V}(\mathbf{y}_i)) = -\frac{1}{2} \left[q \log(2\pi) + \log(|\mathbb{V}(\mathbf{y}_i) - \boldsymbol{\Sigma}|) + (\mathbf{y}_i - \boldsymbol{\mu})' (\mathbb{V}(\mathbf{y}_i) - \boldsymbol{\Sigma})^{-1} (\mathbf{y}_i - \boldsymbol{\mu}) \right]$$

where q is the number of unique elements in $\boldsymbol{\mu}$ and $\boldsymbol{\Sigma}$, and $\mathbb{V}(\mathbf{y}_i)$ is the sampling variance-covariance matrix of \mathbf{y}_i .

Description

This function estimates the mean and covariance matrix of a vector of coefficients using the estimated coefficients and sampling variance-covariance matrix from each individual.

Usage

```
MetaVARMx(
  object,
  mu_start = NULL,
  mu_lbound = NULL,
  mu_ubound = NULL,
  sigma_l_start = NULL,
  sigma_l_lbound = NULL,
  sigma_l_ubound = NULL,
  diag = FALSE,
  intercept = FALSE,
  noise = FALSE,
  error = FALSE,
  try = 1000,
  ncores = NULL
)
```

Arguments

| | |
|----------------|---|
| object | Output of the <code>fitDTVARMx::FitDTVARIDMx()</code> or <code>fitCTVARMx::FitCTVARIDMx()</code> functions. |
| mu_start | Numeric vector. Optional vector of starting values for mu. |
| mu_lbound | Numeric vector. Optional vector of lower bound values for mu. |
| mu_ubound | Numeric vector. Optional vector of upper bound values for mu. |
| sigma_l_start | Numeric matrix. Optional matrix of starting values for $t(\text{chol}(\text{sigma}))$. |
| sigma_l_lbound | Numeric matrix. Optional matrix of lower bound values for $t(\text{chol}(\text{sigma}))$. |
| sigma_l_ubound | Numeric matrix. Optional matrix of upper bound values for $t(\text{chol}(\text{sigma}))$. |
| diag | Logical. If <code>diag = TRUE</code> , sigma is a diagonal matrix. If <code>diag = FALSE</code> , sigma is a symmetric matrix. |
| intercept | Logical. If <code>intercept = TRUE</code> , include estimates of the process intercept vector, if available. If <code>intercept = FALSE</code> , exclude estimates of the process intercept vector. |
| noise | Logical. If <code>noise = TRUE</code> , include estimates of the process noise matrix, if available. If <code>noise = FALSE</code> , exclude estimates of the process noise matrix. |

| | |
|--------|---|
| error | Logical. If error = TRUE, include estimates of the measurement error matrix, if available. If error = FALSE, exclude estimates of the measurement error matrix. |
| try | Positive integer. Number of extra optimization tries. |
| ncores | Positive integer. Number of cores to use. |

Details

For $i = \{1, \dots, n\}$, the objective function used to estimate the mean $\boldsymbol{\mu}$ and covariance matrix $\boldsymbol{\Sigma}$ of the random coefficients \mathbf{y}_i is given by

$$\ell(\boldsymbol{\mu}, \boldsymbol{\Sigma} \mid \mathbf{y}_i, \mathbb{V}(\mathbf{y}_i)) = -\frac{1}{2} \left[q \log(2\pi) + \log(|\mathbb{V}(\mathbf{y}_i) - \boldsymbol{\Sigma}|) + (\mathbf{y}_i - \boldsymbol{\mu})' (\mathbb{V}(\mathbf{y}_i) - \boldsymbol{\Sigma})^{-1} (\mathbf{y}_i - \boldsymbol{\mu}) \right]$$

where q is the number of unique elements in $\boldsymbol{\mu}$ and $\boldsymbol{\Sigma}$, and $\mathbb{V}(\mathbf{y}_i)$ is the sampling variance-covariance matrix of \mathbf{y}_i .

| print.metavarmeta | <i>Print Method for Object of Class metavarmeta</i> |
|-------------------|---|

Description

Print Method for Object of Class metavarmeta

Usage

```

## S3 method for class 'metavarmeta'
print(x, alpha = 0.05, digits = 4, ...)

```

Arguments

| | |
|--------|---|
| x | an object of class metavarmeta. |
| alpha | Numeric vector. Significance level α . |
| digits | Integer indicating the number of decimal places to display. |
| ... | further arguments. |

|------------------|---|
| vcov.metavarmeta | <i>Variance-Covariance Matrix Method for an Object of Class metavarmeta</i> |
|------------------|---|

Description

Variance-Covariance Matrix Method for an Object of Class metavarmeta

Usage

```
## S3 method for class 'metavarmeta'  
vcov(object, ...)
```

Arguments

| | |
|--------|---------------------------------|
| object | an object of class metavarmeta. |
| ... | further arguments. |

Value

Returns the variance-covariance matrix of the estimated parameters.
